EXP 13: Implement the Car Price Prediction Model using Python

CODING:

```
# Car Price Prediction using Linear Regression

# Training Dataset
X = [2018, 2019, 2020, 2021, 2022]
Y = [500000, 600000, 700000, 800000, 900000]

# Calculate Mean
n = len(X)

mean_x = sum(X) / n
mean_y = sum(Y) / n

# Calculate Slope
numerator = 0
denominator = 0

for i in range(n):
    numerator += (X[i] - mean_x) * (Y[i] - mean_y)
    denominator += (X[i] - mean_x) ** 2

slope = numerator / denominator

# Calculate Intercept
intercept = mean_y - slope * mean_x
```

Scanned with OKEN Scanner

```
# Display Training Data
print("Car Price Prediction Model")
print("\nTraining Dataset:")

for i in range(n):
    print("Year:", X[i], "Price:", Y[i])

# Predict Car Prices
print("\nPredicted Car Prices:")

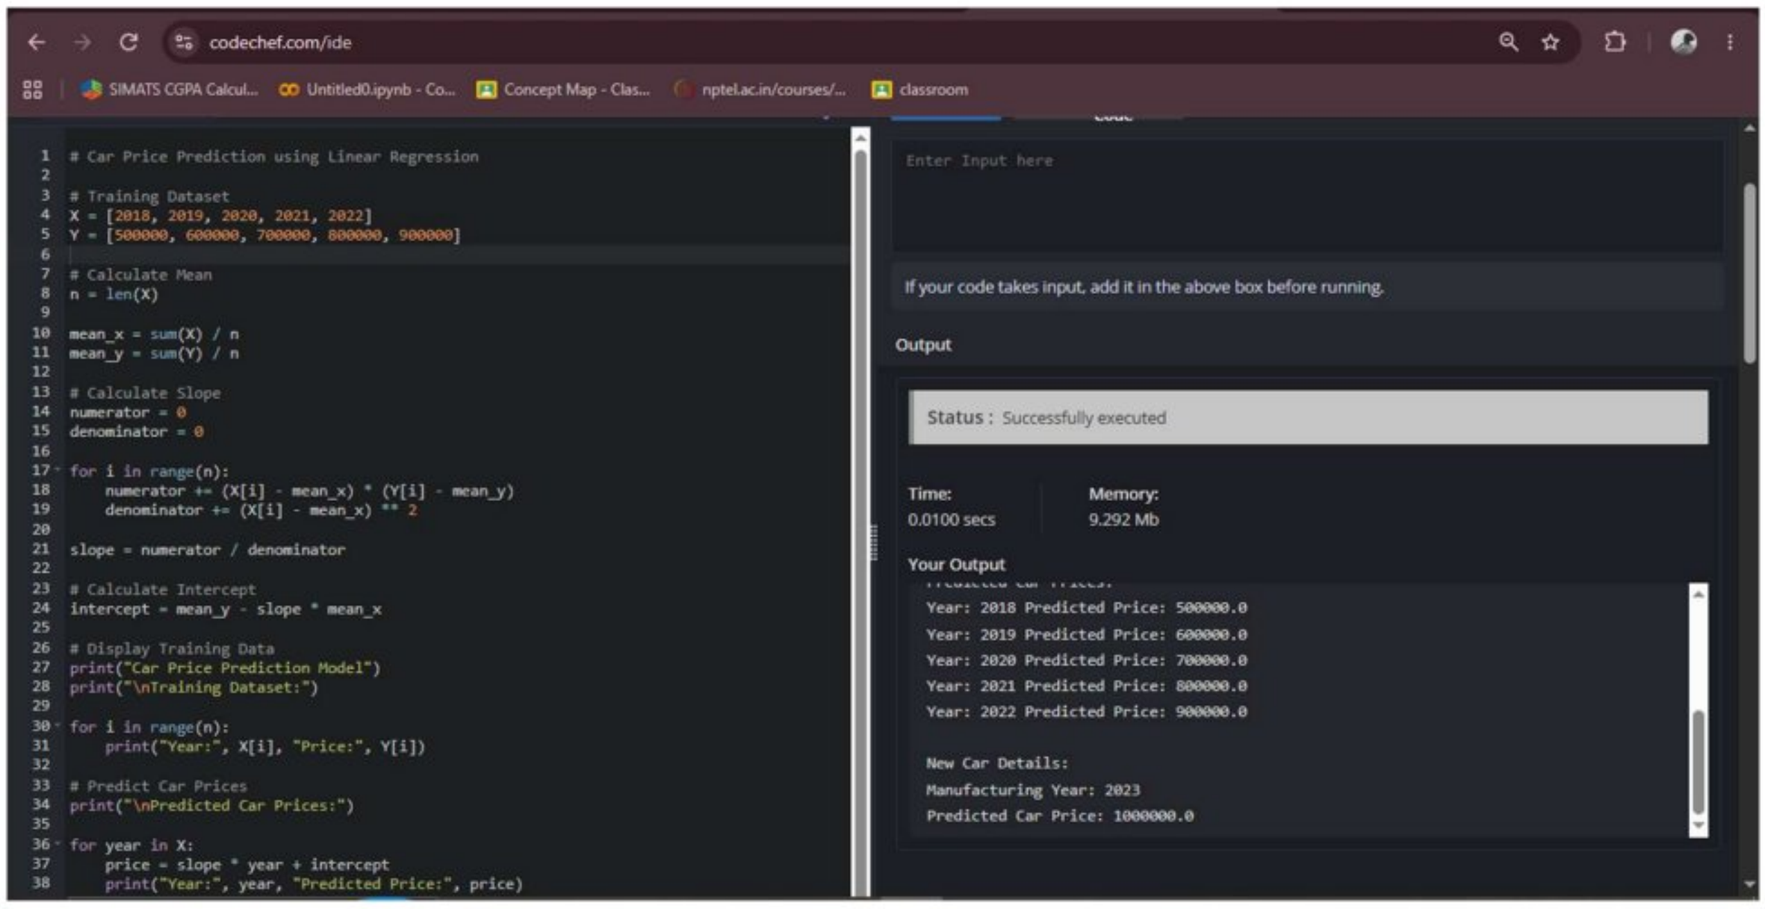

for year in X:
    price = slope * year + intercept
    print("Year:", year, "Predicted Price:", price)

# Predict New Car Price
new_year = 2023
predicted_price = slope * new_year + intercept

print("\nNew Car Details:")
print("Manufacturing Year:", new_year)
print("Predicted Car Price:", predicted_price)
```
