EXP 14: Implement House price Prediction using appropriate machine learning algorithm

CODING:

```
# House Price Prediction using Linear Regression

# Training dataset

# Area in square feet

area = [1000, 1200, 1500, 1800, 2000]

# House prices in rupees

price = [2000000, 2400000, 3000000, 3600000, 4000000]

n = len(area)

# Calculate mean

mean_x = sum(area) / n

mean_y = sum(price) / n

# Calculate slope

numerator = 0

denominator = 0

for i in range(n):

    numerator += (area[i] - mean_x) * (price[i] - mean_y)

    denominator += (area[i] - mean_x) ** 2

slope = numerator / denominator
```

Scanned with OKEN Scanner

```
# Calculate intercept

intercept = mean_y - slope * mean_x

# Predict house price

new_area = 1600

predicted_price = slope * new_area + intercept

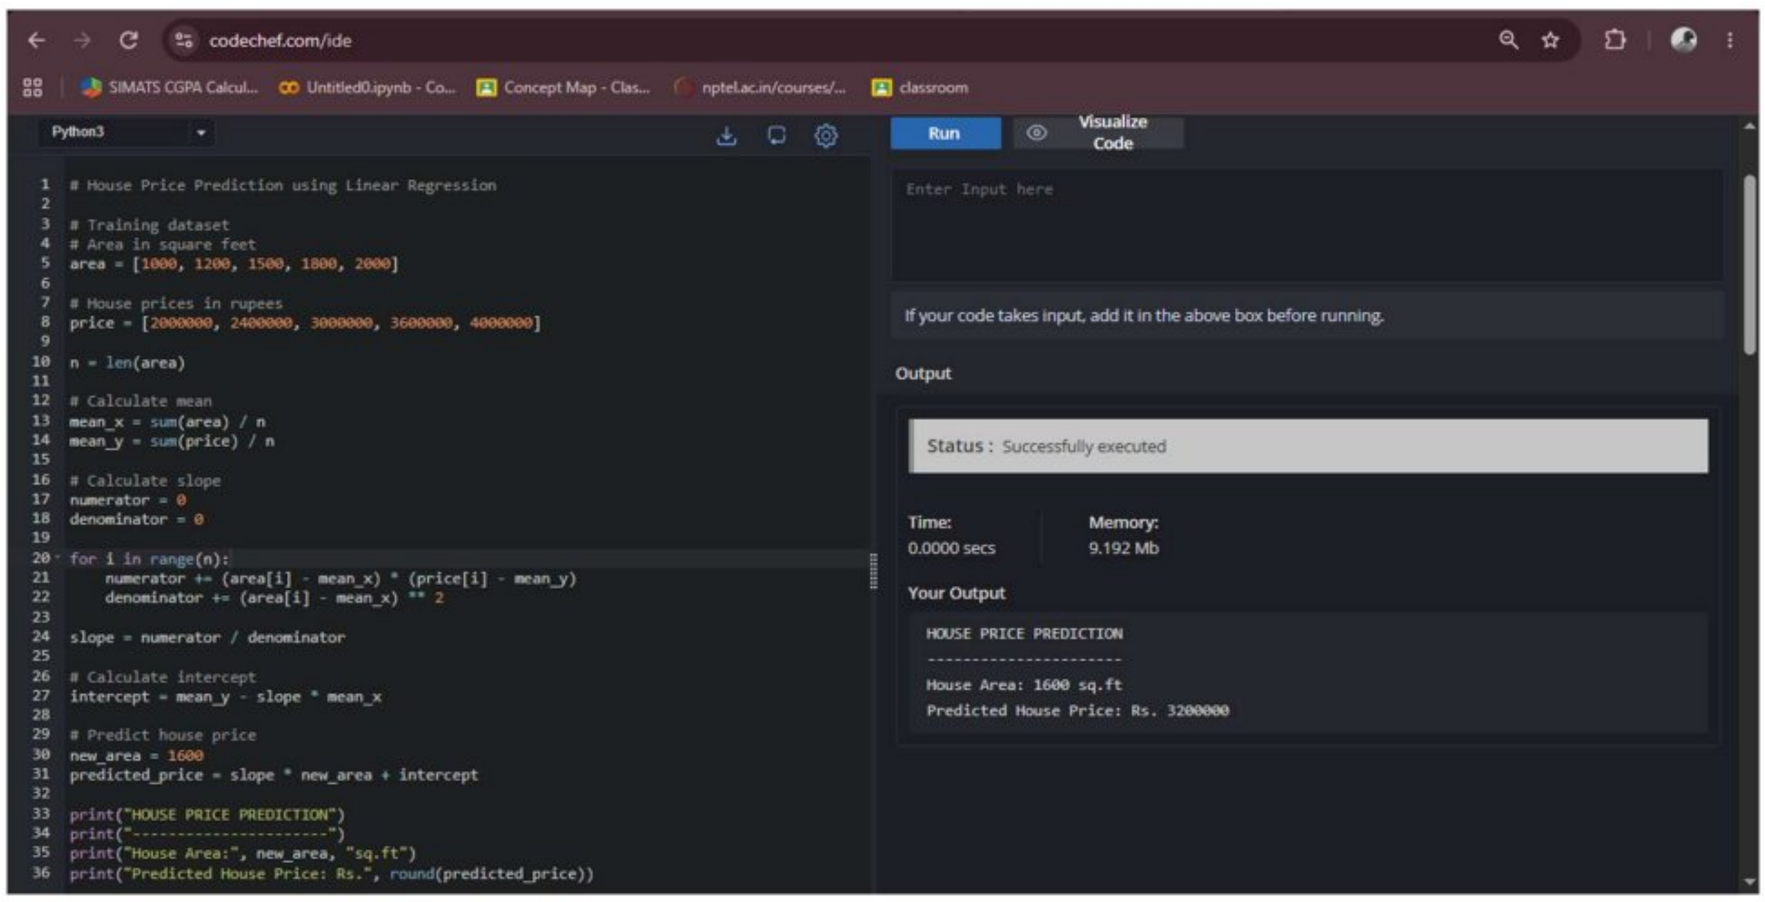

print("HOUSE PRICE PREDICTION")

print("----------------------")

print("House Area:", new_area, "sq.ft")

print("Predicted House Price: Rs.", round(predicted_price))
```
